Installing Puppet agent

In this section we assume you have already installed the `apt` or `yum` Puppet repository on your agent system in the same way that you did on your Puppet Server.

Installation on CentOS/RHEL/Fedora

```
$ sudo yum install puppet
$ sudo puppet resource package puppet ensure=latest
```

Installation on Debian/Ubuntu

```
$ sudo apt-get install puppet
$ sudo apt-get update
$ sudo puppet resource package puppet ensure=latest
```

Configuration

Add the server value to the `[main]` section of the node's `/etc/puppet/puppet.conf` file, replacing `puppet.example.com` with your Puppet Server's FQDN:

```
[main]
server = puppet.example.com
```

Restart the Puppet service:

```
$ service puppet restart
```
